CERT No.: 99-100-20788  
ISO 9001 : 2015

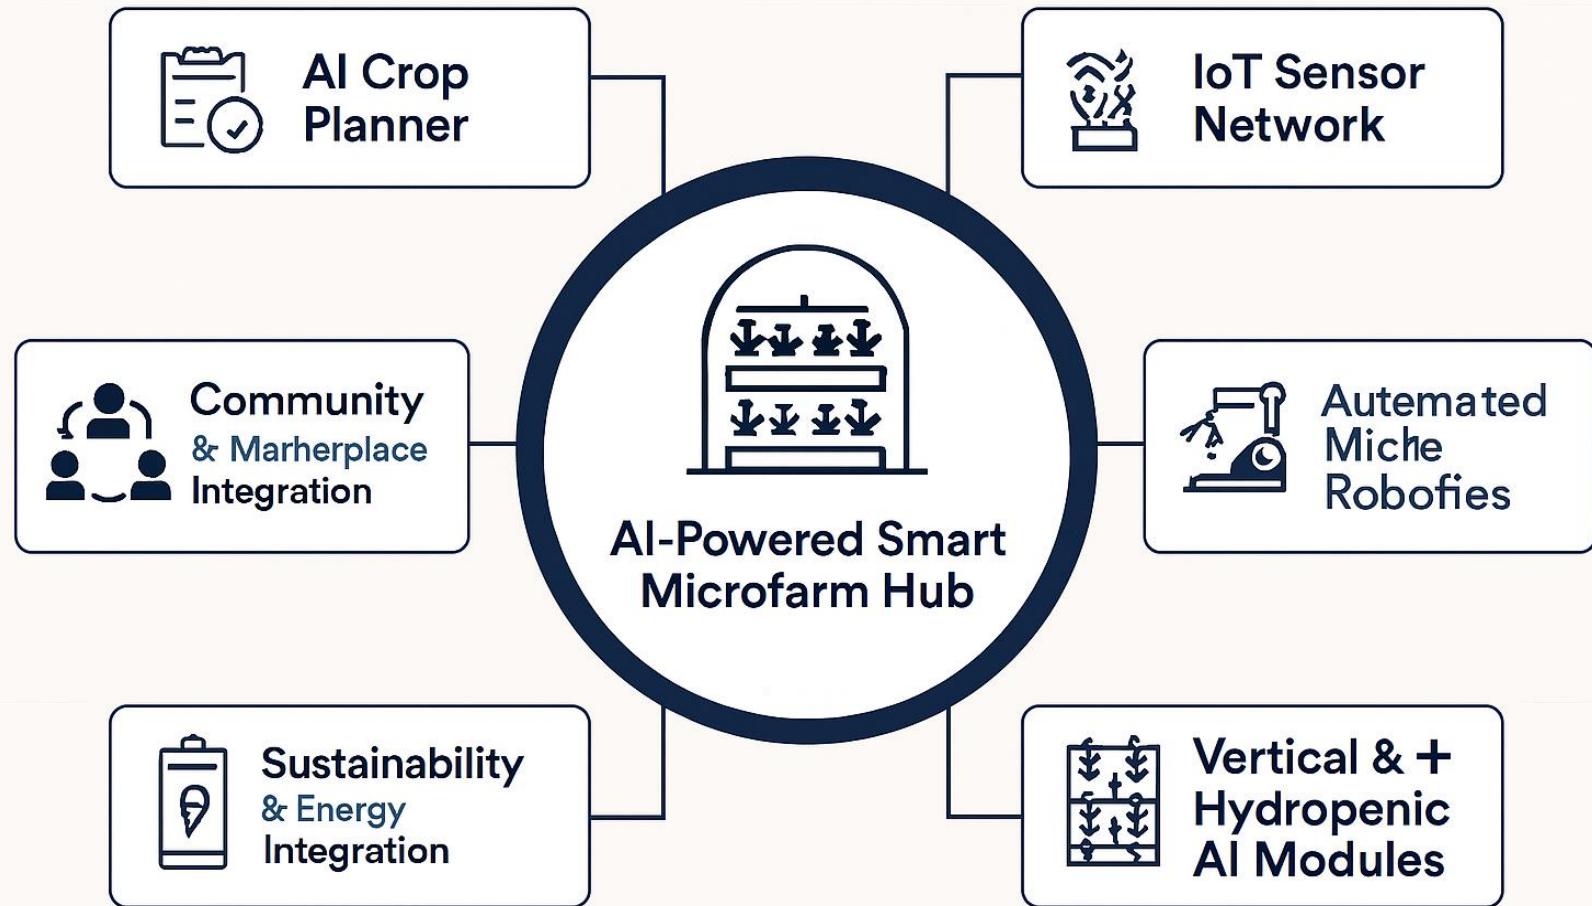

# Problem Statement

- **Limited space** and **high water use** make **traditional farming** unsuitable for urban living.
- **Urban residents, small-scale farmers**, educational institutions, and eco-friendly businesses.
- It promotes **sustainable** food production, saves space and water, and **supports** urban food security.

# Proposed Solution

- A compact, tech-enabled microfarm that uses **AI-powered** to **maximize yield**, sustainability, and efficiency in small urban spaces
- By leveraging AI for **soil monitoring**, **pest control**, and crop planning, it ensures high-quality local produce with minimal space and labor.
- It uniquely combines **AI**, **IoT**, **robotics**, and **vertical/hydroponic farming** in a compact urban setup for self-optimizing, high-yield, and sustainable micro-farming.

# Block Diagram

# Impact & Benefits

- Empowering communities with **fresh food, reducing environmental footprint**, and advancing smart farming through AI-driven innovation.
- Higher crop yields with **lower resource use**, improved food accessibility, and smarter, **low-maintenance** urban farming.

# Feasibility & Future Scope

- Scalable at Small Levels – Can start with **modular units** (sensors + hydroponics + AI app) and expand gradually.
- **Networked Micro-farms** – Link multiple hubs into a citywide grid for collective data sharing and **optimized food distribution**.
- Advanced Automation: Add **drones** and multi-tasking robots for **pollination, pruning, and harvesting**.
